#### **DETAILED ACTION**

### Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-10 are rejected under 35 U.S.C. 102(b) as being anticipated by Holloway et al. (hereinafter "Holloway") (US Patent No. 6,183,131).

Regarding claim 1, Holloway discloses an arrangement on a semiconductor chip for calibrating a temperature setting curve having

a signal generation unit for providing a first signal which is proportional to the actual temperature of the chip, whereby a signal offset creatable by the signal generation unit, which is combined with the first signal defining second signal [see Holloway: col. 11, lines 15-50];

a temperature extraction unit [A/D and summing circuits 114] receiving the first signal and the second signal calculating a first temperature point based on the first signal and a second temperature point based on the second signal, wherein

the second temperature point is a virtual [computed/calculated Tout(K), or Tout(C)] temperature [see Holloway: col. 7, lines 7-67, lines col. 11, line 40-col. 12, line 6].

Regarding claim 2, Holloway discloses that the first signal which is proportional to the actual temperature of the chip, is a current, voltage or a frequency [see Holloway: col. 11, lines 15-40].

Regarding claim 3, Holloway discloses that the first signal and the second signal are convertible into digital signals, whereby the extraction unit calculates the first and second temperature points for calibrating the temperatures setting curves [see Holloway: col. 11, line 40-col. 12, line 6].

Regarding claim 4, Holloway discloses a method for calibrating a temperature setting curve of a temperature sensor arrangement on a semiconductor chip, the method comprising:

reading a first signal which is proportional to an actual temperature of the semiconductor chip [see Holloway: col. 11, lines 15-40]; generating a signal offset, which is combined with the first signal defining a second signal [see

Holloway: col. 11, lines 40-47]; and extracting a first temperature from the first signal and a second virtual temperature from the second signal [see Holloway: col. 7, lines 7-67; col. 11, line 45-col. 12, line 25].

Regarding claim 5, Holloway discloses whereby the first actual temperature and the second virtual temperature are used for providing calibration parameters to the semiconductor chip [see Holloway: col. 7, lines 7-67; col. 11, line 45-col. 12, line 6].

Regarding claim 6, Holloway discloses whereby calculating calibration parameters can be performed on-chip <u>or</u> off-chip [see Holloway: Abstract; col. 7, lines 7-67; col. 11, line 45-col. 12, line 6].

Regarding claim 7, Holloway discloses whereby additional offsets are provided for calculating more than two temperature points and calibrating a non-linear temperature setting curve [see Holloway: col. 2, lines 6-20; col. 11, line 40-col. 12, line 25].

Regarding claim 8, Holloway discloses that whereby the signal offset is subtracted from the first signal or added to the first signal defining a second signal, which is provided to the temperature extraction unit [see Holloway: col. 11, line 45-col. 12, line 25].

Regarding claims 9 and 10, Holloway discloses that the second temperature point [computed Tout(K) or Tout(C)] does not exist in the semiconductor chip during calibration of the temperature setting curve [see Holloway: col. 11, lines 5-50].

## Response to Arguments

2. Applicant's arguments filed 12/28/2008 have been fully considered but they are not persuasive.

Applicant argues that Holloway does not disclose "a **virtual** temperature" [which is calculated from a signal that is a combination of a signal representative of an actual temperature and a signal offset [see Applicant's Remarks: Pages 4-5].

Accordingly, Holloway, in col. 11, lines 5-15 discloses the **computed** [or virtual] output temperature Tout(K) orTout(C):

"The hyperbolic reference voltage Vhreff, which is the summed reference voltage Vref and correction voltage Vcorr, is provided to an amplifying circuit 110 that divides the hyperbolic reference voltage Vhreff with a scaling factor C. The scaling factor C provided by amplifying circuit 110 is used to generate the  $C_{\beta cal}$  value derived in equation 14. Thus, amplifying circuit 110 generates a voltage

Application/Control Number: 10/562,101

Art Unit: 2857

output signal Vo that is equivalent to the hyperbolic reference voltage Vhreff multiplied by the reciprocal of C. The voltage output signal V<sub>0</sub> from amplifying circuit 110 is used to normalize the linearly-temperature-dependent voltage V<sub>TEMP</sub> generated by thermometer circuit 104. Thus, both voltage output signal Vo and the linearly-temperature-dependent voltage V<sub>TEMP</sub> are received by an A/D converter 112 that computes a digital fraction representing the ratio of the two voltages, i.e., V<sub>TEMP</sub> /Vo, to a resolution of N bits. The A/D converter 112 produces a temperature output signal T<sub>OUT (K)</sub> in degrees Kelvin, which is therefore equivalent to: equation 19:  $T_{OUT(K)} = T_{FS} (V_{TEMP} / Vo)$  where  $T_{FS}$  the full scale digital output of the converter in Kelvin and may be chosen, e.g., to be 512 degrees Kelvin. A summing circuit 114 receives the temperature output signal T<sub>OUT (K)</sub> from A/D converter 112 and subtracts 273.15.degree. K, which is the Kelvin equivalent of  $0^{\circ}$ C, to convert the temperature output signal  $T_{OUT(K)}$  in degrees Kelvin to degrees Centigrade. Summing circuit 116 is used to add a temperature offset correction term K to the output signal from summing circuit 114 to produce the final temperature output signal T<sub>OUT (C)</sub> in degrees Centigrade. The temperature offset term K provided by summing circuit 116 is equivalent to the temperature correction offset term as derived in equation 17. The appropriate temperature offset correction term of the temperature sensor can easily be determined by adjusting the temperature sensor at ambient temperature to produce the appropriate output signal".

#### Conclusion

3. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to PHUONG HUYNH whose telephone number is (571)272-2718. The examiner can normally be reached on M-F: 8:30 AM - 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Eliseo Ramos-Feliciano can be reached on 571-272-7925. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
